

A.C., Goethe University Frankfurt, Germany:

I think the course is really interesting. I have learned a lot about renewable energies that I haven't learned so far and with the mixture of Russian students and international students, there is a good vibe. I am also really interested in the topic that I held my presentation about and I didn't know a lot about that before. The case study was a quite challenging task but I enjoyed it. The course differs a lot from my economics courses at home; we only discuss really theoretical approaches that can't be applied at all in practice. But in this course, it is the first time that I learn more than just mathematical theory because we discuss really realistic approaches.

Y. Z., Erasmus School of Economics, Netherlands:

This course allows me to broaden my horizon on energy economics. I did not have any previous knowledge on this field before I attended the lecture but now I have the interest to study and know more about it.

The lectures that we have had are very inspiring. And the case study that we did is also very interesting. I learnt how the assessment on energy projects works and I came up with some ideas to better help better perform in the auction. Even though for the time reason I did not manage to implement it but in the later stage of my study I will definitely try to solve this problem in conjunction with my expertise.

Another thing I like about this course is that it arouses my interest in the energy market in the middle-east, which I think is of great importance in understating the political issues between gulf country and the western world. This interest will continue after the end of this course. I will read more about the relevant theory on this topic and form my own insights.

I am very thankful of having the opportunity to participate in this course. It opens up a new possibility of my future interest of work and this influence will be long-lasting and far-reaching.
